

1. Rightsizing

Rightsizing means matching instance types to real workload demand rather than over-provisioning, which removes the waste of paying for idle capacity.

2. Reserved Instances

Reserved instances require a one or three year commitment in exchange for a large discount over on-demand pricing, and suit steady, predictable baseline workloads.

3. Spot Instances

Spot instances use spare capacity at up to ninety percent discount but can be reclaimed with two minutes notice, so they fit fault-tolerant, interruptible batch jobs.

4. Storage Tiering

Storage tiering automatically moves infrequently accessed data to cheaper cold tiers, reducing storage cost while keeping the data retrievable when it is needed.

5. Tagging and Accountability

A consistent resource tagging policy attributes every cost to a team or project, which is the foundation of accountability and chargeback.

6. Autoscaling

Autoscaling adjusts capacity up and down with demand so you never pay for a permanently peak-sized fleet during quiet periods.

7. Savings Plans

Savings plans are flexible commitment discounts that apply across instance families and regions for a predictable hourly spend.

8. Budgets and Alerts

Budgets with threshold alerts catch runaway spend early, at the moment it crosses a limit, rather than at the end-of-month invoice.
